Shopify Speed Checklist

A practical audit sheet for store owners who want a faster storefront, smoother mobile experience, and clearer next steps.

What you will get
☐ The highest-impact speed issues to review first
☐ A simple way to prioritize theme, app, and media fixes
☐ Fast checks you can run without deep technical knowledge

Built for quick wins first. Use this checklist to spot obvious problems, prioritize fixes, and create momentum before you spend money on a full rebuild.

How to use this PDF
☐ Review each page once from top to bottom
☐ Mark the items that are already done
☐ Circle the 3 to 5 highest-impact fixes
☐ Turn those fixes into your next sprint or support request

Free resource by Zaid Ahmad

Shopify and WordPress developer. 1:1 technical support, speed optimization, implementation, and tutoring.

Start here: the 80/20 audit

Do these first before you touch anything advanced. The goal is to remove obvious blockers that hurt load time, mobile browsing, and conversion flow.

Homepage and navigation	Product and collection pages
☐ Homepage hero is not overloaded with huge media files	☐ Product pages do not load too many third-party widgets at once
☐ Top navigation is clear and does not rely on heavy scripts	☐ Collection pages are still usable with filters enabled
☐ Announcement bars, popups, and sliders are kept under control	☐ Variant selectors and add-to-cart do not lag
☐ Important collections or products are reachable in 1 to 2 taps on mobile	☐ Product recommendations are relevant and limited

Quick win rule

If an element is not helping discovery, trust, or conversion, it should not make your page heavier.

Media audit

Large images and videos are one of the most common causes of a slow storefront. Review media before you assume the theme is the problem.

Check every major template for these issues
☐ Images are exported close to display size, not massive originals
☐ Decorative images are compressed before upload
☐ Video is used only where it adds real selling value
☐ Autoplay video is avoided above the fold unless essential
☐ Multiple banners or sliders are not competing on the same page
☐ Every collection card image is optimized for mobile browsing

Apps and scripts

Many speed issues come from app bloat, marketing tags, and scripts that run sitewide even when they are only needed on a few pages.

Audit the app stack	Audit scripts and tracking
☐ Remove apps that duplicate each other	☐ Review old pixels, tag managers, and injected scripts
☐ Remove apps that are no longer used operationally	☐ Delay non-essential scripts where possible
☐ Review whether old trial apps left code behind	☐ Avoid stacking multiple chat, popup, or review tools
☐ Limit app widgets on product pages	☐ Test pages after marketing tools are added

Ask your developer or agency these 4 questions
Which apps are adding code to every page?
What can be delayed until after the first render?
Which sections are the heaviest on mobile?
What is the fastest path to visible speed improvement in the next 7 days?

Theme and UX performance

Speed is not just technical. A page can technically load and still feel slow because the experience is cluttered, confusing, or overloaded.

Look for friction that feels like slowness
☐ Too many moving parts above the fold
☐ Slow-feeling mega menus or oversized dropdowns
☐ Product pages with too many stacked sections before the main CTA
☐ Mobile screens that require excessive scrolling before action
☐ Forms, popups, and sticky elements fighting for attention

How to prioritize fixes

Do not try to fix everything at once. Use this order to get momentum fast and keep scope under control.

Priority order
1. Homepage media and above-the-fold clutter
2. Product page app widgets and script-heavy sections
3. App cleanup and script review
4. Collection page filter or image issues
5. Lower-priority cosmetic optimizations

Your 7-day action plan
☐ Pick one template that matters most to revenue
☐ Identify the 3 heaviest sections on that template
☐ Compress or replace the largest media assets
☐ Remove at least one unnecessary app or widget
☐ Test again on a real phone, not just desktop
☐ Track whether the page feels faster and easier to use

Need help implementing the fixes?

If you want someone to review the storefront, clean up the theme, reduce app bloat, or improve the mobile experience, book a discovery call at zaidahmaddev.com.
